

BEFORE THE NEXT EDIT

What calls the helper your agent is changing?

Start with one function. Follow the callers.
Then check the source.

limitFunction()**pLimit()****validateConcurrency()**

Two recorded call relationships, confirmed against
p-limit v7.3.2 source. Diagram redrawn from the evidence.

[Open the source-linked example](#)

CHECK THE MAP AGAINST THE CODE

Source review found another path.

The concurrency setter also calls the validator.
The saved map had no separate setter node.

```
limiter.concurrency = value
```

also calls the validator

```
validateConcurrency()
```

**That missing path changes the review checklist:
check updates to an existing limiter, too.**

The first query returned an immediate caller. A second query exposed the wrapper. One query was not all impacts.

[Inspect the setter and recorded map limits](#)

FROM A MAP TO A CHECKLIST

Check the public paths, then read the results.

- 01 Create a limiter with pLimit.
- 02 Create one through limitFunction.
- 03 Change an existing limiter's concurrency.

LATER CHECKS ON THE SAME PINNED SOURCE

23 upstream runtime tests passed

Type tests + 47 added assertions passed

Combined npm test failed in lint

Checks ran September 11; source stayed unchanged.
A map, a passing subset, and a full pass are distinct results.

TRY IT ON ONE HELPER

Make the next edit easier to review.

- 01 Create a free beta account and confirm your email.
- 02 Connect Codex using the setup guide.
- 03 Map one helper in a project you may inspect.

Ask for recorded callers, compare them with source, and identify one affected behavior and one test.
Leave source code unchanged.
